*Аннотация:* *Образование имеет большое значение в формировании культуры получения информации, а развитие системы образования и способность каждого человека эффективно использовать информацию рассматривается как фактор, обуславливающий подъем общества.*

*Ключевые слова*: *информационная культура, социальные сети, средства информационной коммуникации, глобальные информационные ресурсы, цифровые технологии.*

The 21st century is characterized by the predominance of global and informational features of society in world civilization. Various strategic policies and convergence of developing economies are becoming more and more global, therefore, these processes are leading to the high development of information technologies and global the virtual and digital space is covering various aspects of the socio-economic, political and cultural life of the integrating countries. The possibilities of modern information systems are limitless, they are developing at

cosmic speed, and the issue of their introduction has already become a priority direction of the strategic task of Uzbekistan.

Development of techniques and technologies in recent years Information sources and information providers (libraries, archives, Internet, bloggers, Instagram viners, celebrities promoting risk-based games, in particular online gambling through social networks, more than 100 advertisements of totalizator and bookmaker activities) led to an incomparable expansion of its activity and made it possible for citizens, students and a wide range of users to use and exchange its huge levels. The demand for information services, along with the emergence of a vast array of paid and free online resources on the Internet, has pushed this aspect of information services to higher than ever. As a collection of various religious information, texts of well-known Islamic scholars who serve pure Islam, video-materials and knowledge, the methodology and technology of its delivery, as well as the order of its distribution and delivery to students of secondary specialized Islamic educational college, are becoming an important tool in the activities of modern society.

However at the same time, the activity of promoting products in various social networks of Giveaway has become very active, it is quickly becoming popular among active users of social networks as a new way to earn money in a short time. Giveaway is a contest held among users of the social network on the Instagram page of viners, YouTubers, bloggers, singers and celebrities. An important condition for participation in this contest or competition is to subscribe to the pages of the sponsors listed on the page opened specifically for the contest.

By placing an expensive car and even apartments as the main prize through Give-Away promotion, simple users who are misleading our consumer public by putting false or abstract information, promoting and not corresponding to the actual situation at all, causing sharp discussions and expressing negative opinions on social networks.

Also, according to the analysis of the results of sociological research, according to the use of world electronic scientific and educational resources by students studying in higher education colleges: **26% - ISLOM.UZ , 41% - MUSLIM.UZ, 10% -Edu.uz, 11% - my.gov.uz, 6% - KUN.UZ, 6%- ZiyoNet.uz. According to the research analysis, it was found that there is a high demand for MUSLIM.UZ and ISLOM.UZ. (Figure 4**)

Also, students use foreign scientific and educational online information resources through websites. The development of modern education is determined not by the improvement of information technologies, but by the availability of new sources of scientific and educational information. The use of electronic educational resources plays an important role in educational and scientific activities.

At the heart of the reforms being carried out in the field of education, it was found that our young people, who speak fluently several foreign languages and know English perfectly, the indicator of problem-free use of scientific and educational online information resources is growing dynamically.

There are problems with the implementation of digital information technologies in some areas of education. This, in turn, not only negatively affects young people becoming mature specialists, but also affects the exchange of information within their professional activities. Also, effective use of free time is one of the most effective measures to prevent information and psychological attacks.

According to research conducted by the Central Asian Bureau for Analytical Reporting (CABAR.asia), Uzbeks began to see social networks and messengers as an alternative source of information and became the main source of information exchange among people aged 16-45. Also, the complexity of controlling information in the Telegram messenger is that it created favorable conditions for the spread of various prohibited information and fake messages, which, in turn, affected the expansion of the information audience.

The activities of bloggers who convey their personal opinions on socio-political events and processes to their subscribers, study their appeals, and

introduce a certain point of view to their audience are also popular in Messenger. According to experts, they are a new generation of Internet journalism, and bloggers do not create in one direction, they try to influence the formation of public opinion on a certain issue by adapting and disseminating information to trends in society.

According to E. Toffler, humanity is "stepping into a new era of evolutionary development" through information. It is not just a changed society, but the building of an entirely new society.' It is not easy to build such a society; it requires deep scientific research in many theoretical and practical aspects.

In conclusion, it should be noted that today social networks and messengers have become the main means of information exchange and can be widely used in shaping public opinion. The possibilities of traditional mass media to satisfy people's need for information are getting smaller and smaller. At the same time, without solving the problem of restricting, closing or banning information, the development of norms for management, regulation, and use of the information system remains one of the most urgent issues today.
